Software Vulnerability Disclosures

Operating system, Browser and Application Disclosures

How We Got Here

- Through 1980s, security was about insiders
 - Studies and experiments demonstrated potential for attacks on software
 - No real examples
 - “Nobody would ever...”
- Computer security treated as a theoretical problem
 - Prove it’s secure and you’re done forever
 - Market proved unsympathetic (or absent) – projects canceled, no real products

How We Got Here

- PC and Internet changed the rules
 - Viruses, information sharing, “outside” and “inside” indistinguishable
 - Vulnerability research for reputation
- Vulnerability research led to security response process
 - Fix the problems when they’re found
- “Secure Windows Initiative” to make software secure
 - Assigned three program managers to review Windows
 - Evolved to training and “bug bashes”

How We Got Here

- Thought we'd done "better" with XP, and then...
 - Code Red
 - Nimda
 - UPNP

From: Bill Gates

Sent: Thursday, 18, 2002

Subject: Trustworthy Computing

As I've talked with customers over the last year - from individual consumers to big enterprise customers - it's clear that everyone recognizes that computers play an increasingly important and useful role in our lives. At the same time, many of the people I talk to are concerned about the security of the technologies they depend on...

How We Got Here: The Security Push Era

- Security push
 - Team-wide stand-downs and training
 - Threat model, review code, run tools, conduct tests, modify defaults
 - (Relatively) quick way to significant improvement
 - Immature and ad hoc processes
- “Security science”
 - Identify and remove new classes of vulnerabilities
- Security “audit”
 - Independent review – what did the push miss?

Selling the Process

- Security pushes were an “obviously” necessary response...
- Security pushes achieved rapid improvements (some dramatic) but...
- Leverage comes from early (design time) focus on security
- Ongoing attacks demonstrated continued need
- Executive buy-in surprisingly easy in retrospect
 - Everyone understood what bad things could happen
 - Security pushes had accomplished enough to allow us to claim we could do this

The Microsoft SDL

Goals

Protect Microsoft customers by

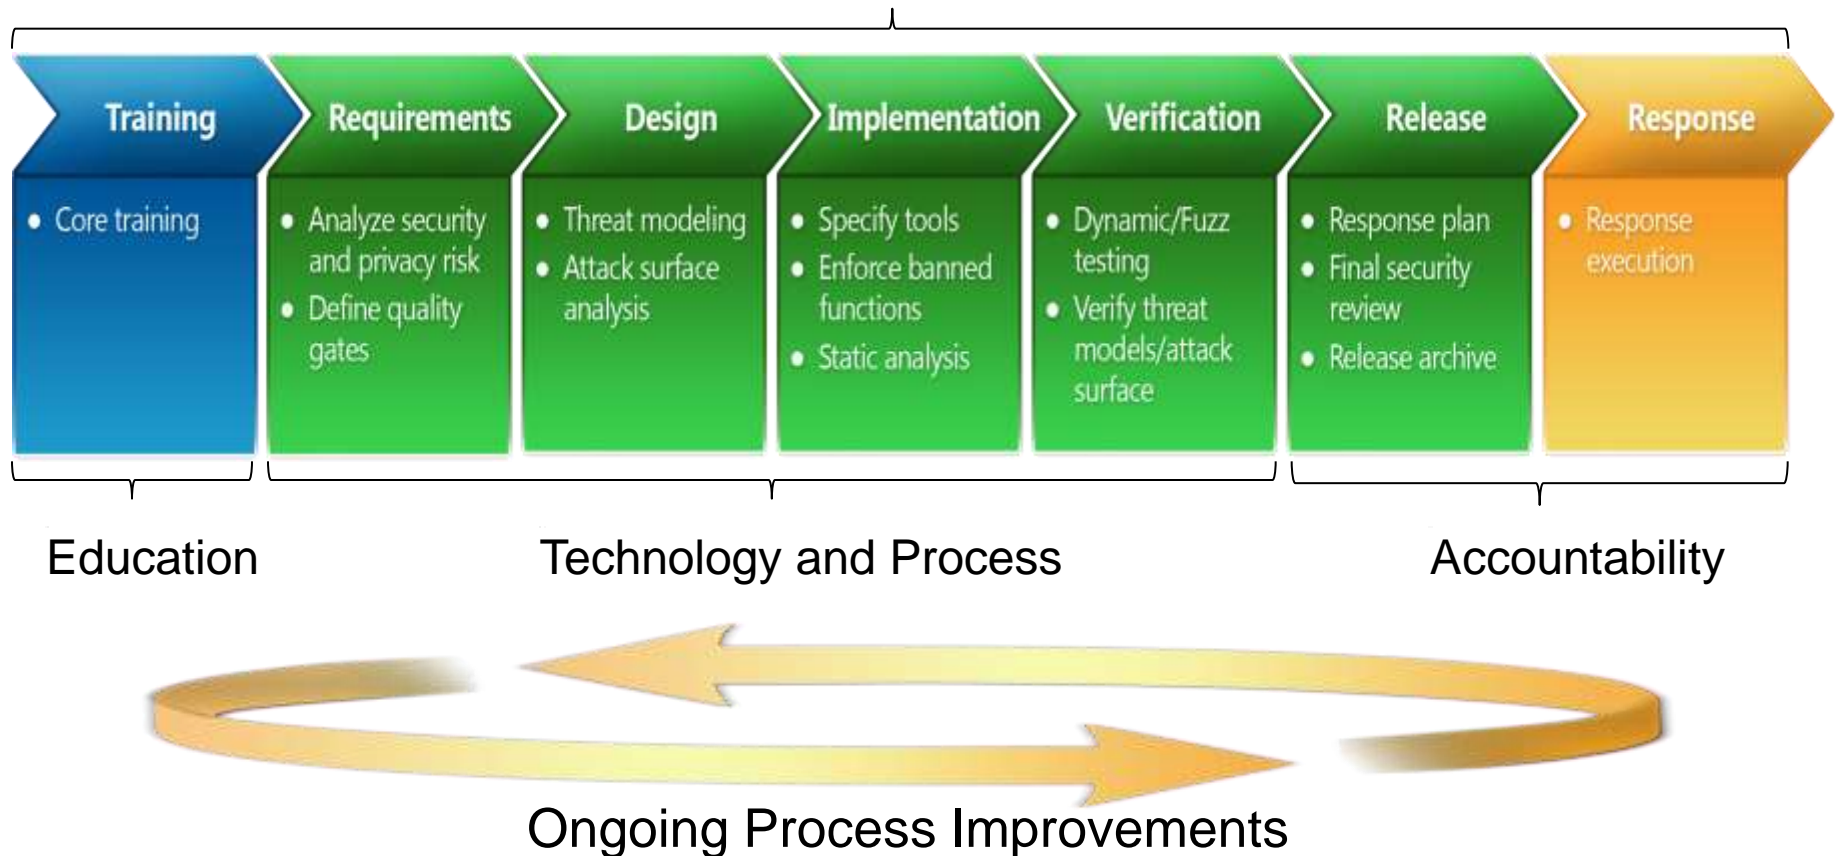

- Reducing the *number* of vulnerabilities
- Reducing the *severity* of vulnerabilities

Key Principles

- Prescriptive yet practical approach
- Proactive - not just “looking for bugs”
- Eliminate security problems early
- Secure by design

The Classic SDL at Microsoft

SDL for Agile at Microsoft

- Requirements defined by frequency, not phase
 - Every-Sprint (most critical)
 - One-Time (non-repeating)
 - Bucket (all others)
- Great for projects without end dates, like cloud services

Managing Change

- The first (2004) iteration of the SDL was pretty rough
 - Developed rapidly based on security push lessons
- Initial updates at 6-month intervals
 - Responses to new threats
 - New application classes (privacy, online services)
 - New requirements and techniques (e.g. banned APIs, new fuzzers)
- Since SDL v4 (October 2007), annual updates
 - More time for tool development
 - More time for beta and feedback
 - More time for usability
- Every update receives both broad and senior review

Process Improvement Timeline at Microsoft...

Now

2005-2007

2004

2002-2003

- Bill Gates writes "Trustworthy Computing" memo early 2002
- "Windows security push" for Windows Server 2003
- Security push and FSR extended to other products

- Microsoft Senior Leadership Team agrees to require SDL for all products that:
 - Are exposed to meaningful risk and/or
 - Are Process sensitive data

- SDL is enhanced
 - "Fuzz" testing
 - Code analysis
 - Crypto design requirements
 - Privacy
 - Banned APIs
 - and more...
- Windows Vista is the first OS to go through full SDL cycle

- Optimize the process through feedback, analysis and automation
- Evangelize the SDL to the software development community:
 - SDL Process Guidance
 - SDL for Agile
 - SDL Optimization Model
 - SDL Pro Network
 - SDL Threat Modeling Tool
 - SDL Process Templates

Automation and Tools

- At Microsoft today, the SDL requires three classes of tools
 - Automated tools to help find (and remove or mitigate) security problems
 - Automated tools to help product teams record and track their compliance with the SDL
 - Automated tools to help the MSEC PM (security advisor) help the product teams
- We started with only the first (problem finders)
- All three are critical to our implementation of the SDL – and we've changed our release cadence largely in recognition of this fact

Things we have learned

- “There is nothing special about security”
 - It’s simply part of getting the job done.
- Get to a knowledge baseline
 - You must raise the collective security IQ to a baseline level
 - Don’t try to make everyone a security expert
- You’re in or you’re out
 - Existing software development practices do not foster secure software, you must change your development process
- Executive Support is Key
 - If the execs don’t “get it” you’ll make marginal progress
- Deprecate old Functionality
 - Old functionality was developed in a different era, with different security landscape
 - Unfortunately, your users have become accustomed to the features!

Things we have learned

- Reduce Friction
 - Few software people are true security experts so we must make security as easy as possible for them
 - Automate, use static analysis tools, better libraries, updated C/C++ compilers
- You'll never reach 'perfection'
 - As long as attackers and researchers are drawing breath, new bugs will be found
 - The odds are against you
- Today's DoS is tomorrow's RCE
 - We have seen time and again what's generally considered a DoS become a way to execute code: "Attacks only get better"
- You will never get the code right. Ever!
 - The software industry spends an incredible amount of time trying to get the code right
 - The SDL focuses a great deal on defenses, not just getting the code right

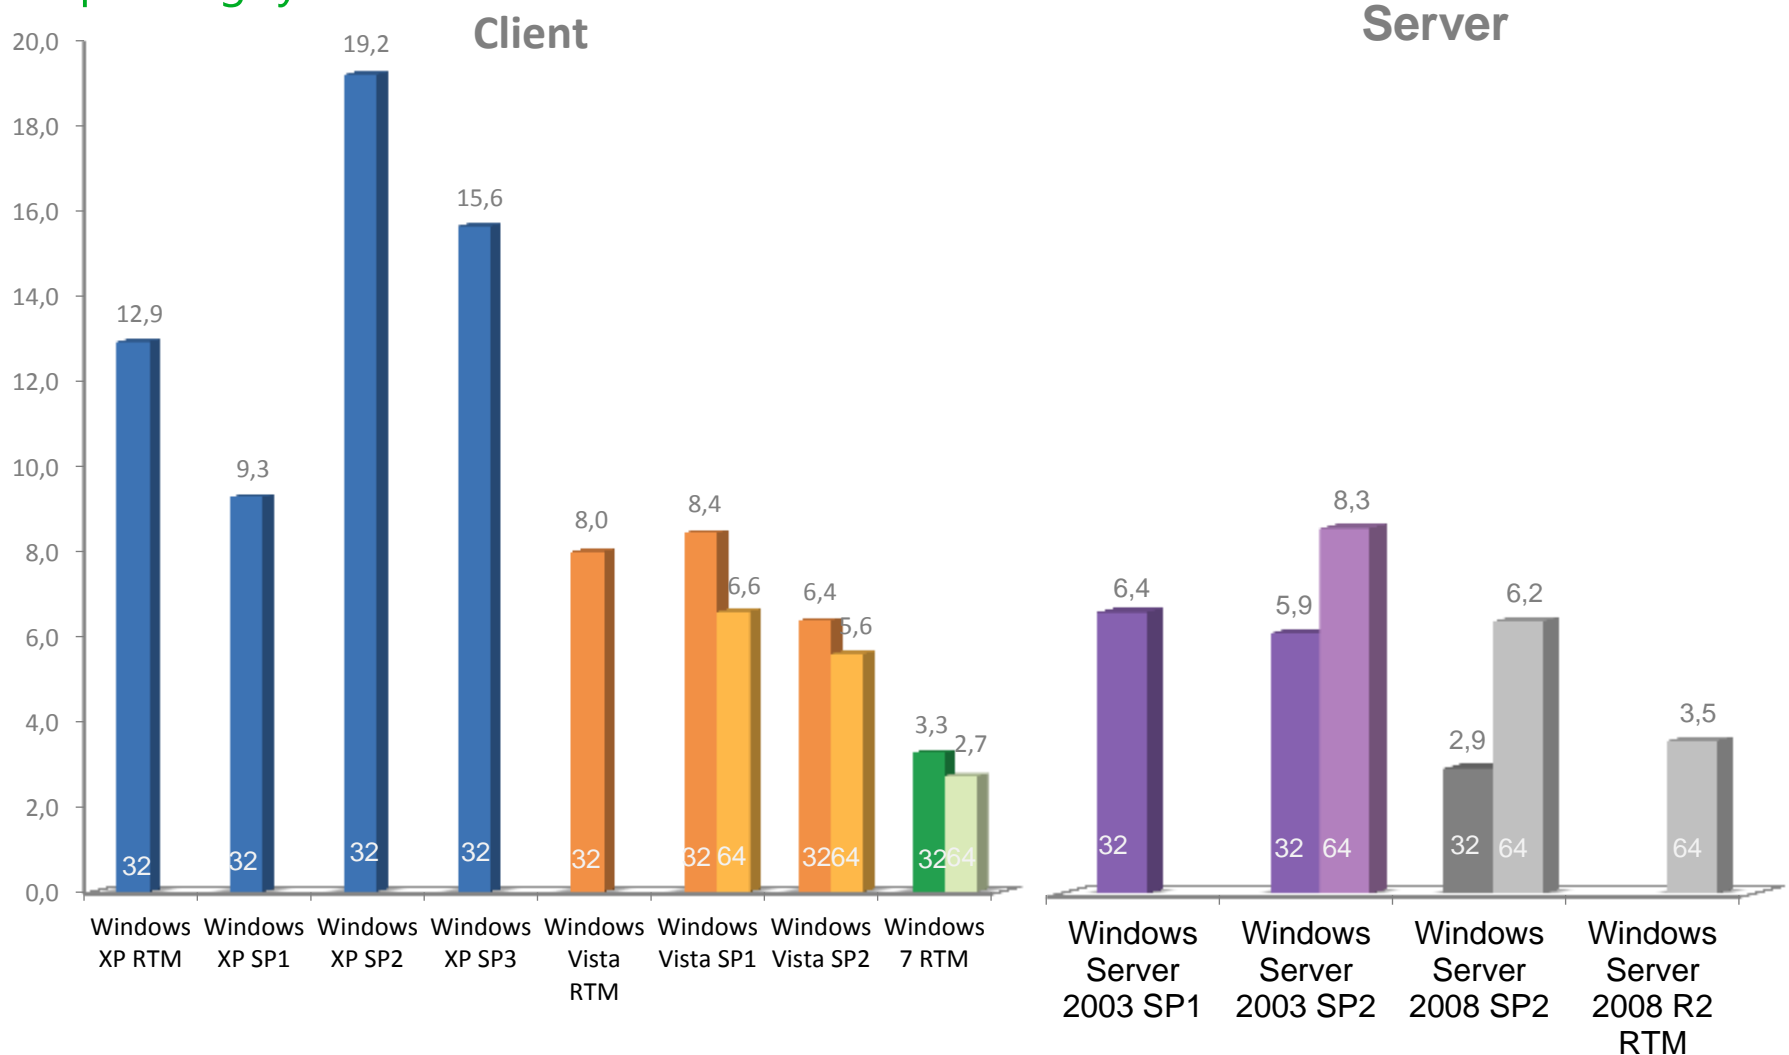

Why Defenses are so Important

Security Advisory 979352 – IE 0Day

	Windows 2000	Windows XP	Windows Vista	Windows 7
Internet Explorer 6	Exploitable	Exploitable (current exploit effective for code execution)	N/A (Vista ships with IE7)	N/A (Windows 7 ships with IE 8)
Internet Explorer 7	N/A (IE 7 will not install on Windows 2000)	Potentially exploitable (current exploit does not currently work due to memory layout differences in IE 7)	IE Protected Mode prevents current exploit from working.	N/A (Windows 7 ships with IE 8)
Internet Explorer 8	N/A (IE 8 will not install on Windows 2000)	DEP enabled by default on XP SP3 prevents exploit from working.	IE Protected Mode + DEP enabled by default prevent exploit from working.	IE Protected Mode + DEP enabled by default prevent exploit from working.

Malicious And Potentially Unwanted Software

Operating system trends

Number of computers cleaned for every 1,000 MSRT executions, by operating system, 2Q10

The SDL and the CWE/SANS Top 25

- The SDL addresses all CWE/SANS Top 2009 issues
- Through one or more of:
 - Education
 - Manual Process
 - Tools
 - Threat Model
- <http://blogs.msdn.com/sdl/archive/2009/01/27/sdl-and-the-cwe-sans-top-25.aspx>

Who Needs the SDL?

Subject: I swear, i'm giving our kids normal names...

Today's XKCD (<http://xkcd.com/327/>)

Objections to the SDL

"...only for Windows"

- *Based on proven, generally accepted security practices*
- *Appropriate for non-Microsoft platforms*

"...for shrink-wrapped products"

- *Also covers Line of Business (LOB) and online services development*

"...for waterfall or spiral development"

- *Agile methods are also supported*

"...requires Microsoft tools"

- *Use the appropriate tools for the job*

"...requires Microsoft-level resources to implement"

- *SDL as its applied at Microsoft != SDL for other development organizations*
- *Some smaller organizations have adopted*

Adapting the SDL to Organizations Beyond Microsoft

- *Non-proprietary*
- *Scalable to organizations of any size*
- *Platform agnostic*
- *Based on the SDL process used at Microsoft*

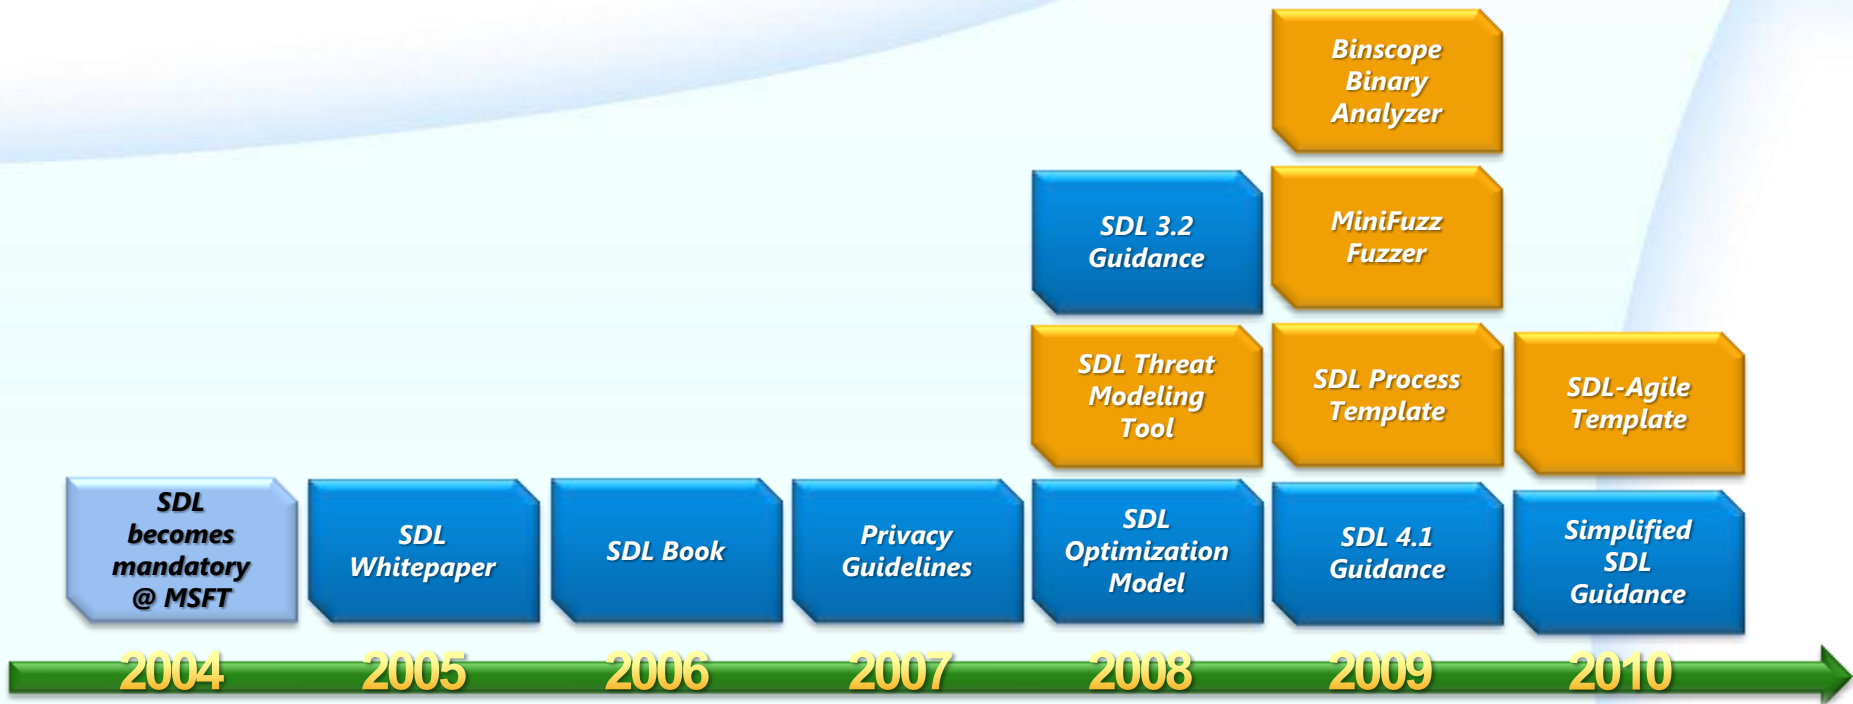

Who Uses the SDL?

- Short answer: we don't know
- You have to click through a EULA to download the tools, but you don't have to register so...
- We have worked with some large organizations on adopting and adapting the SDL (mostly not public)
- We've seen the Errata survey, and had some users (large and small) tell us they're using the SDL
- Finding the answer is one of our objectives for the next year

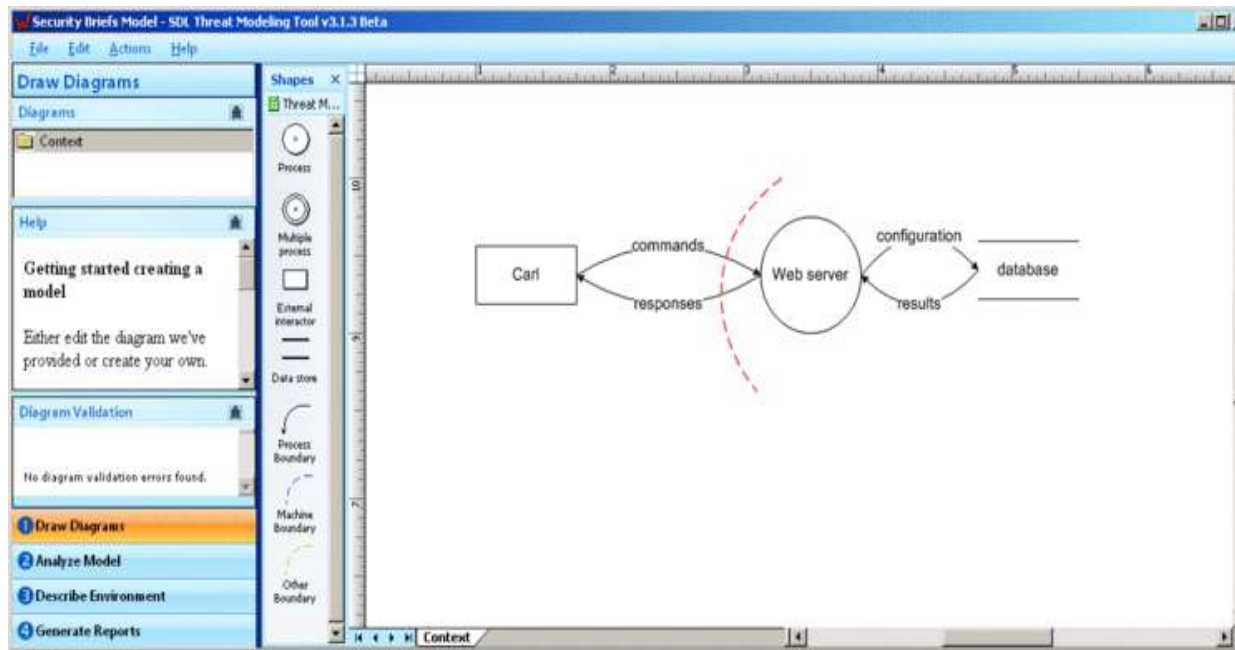

Resources at a glance...

SDL Threat Modeling Tool

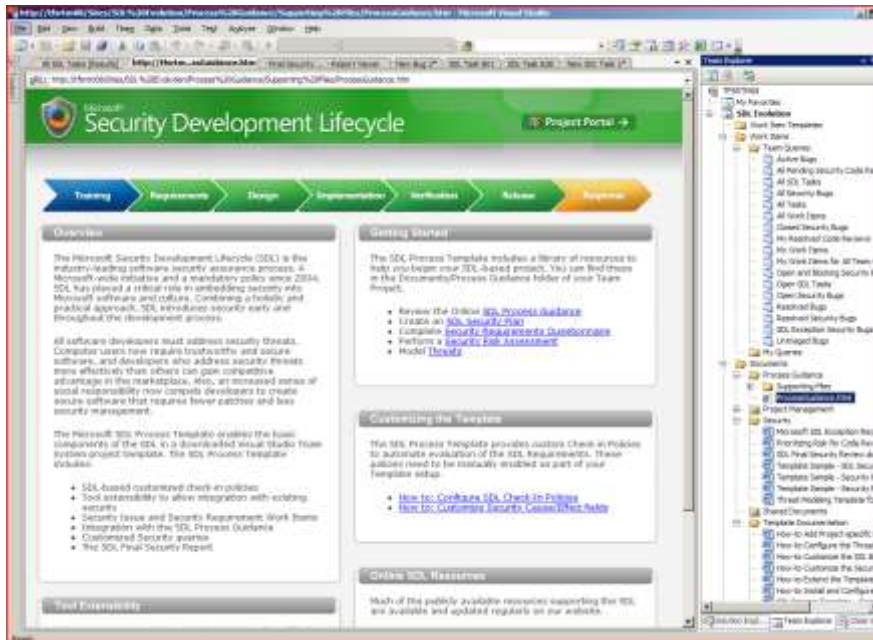

Transforms threat modeling from an expert-led process into a process that any software architect can perform effectively

Provides:

- Guidance in drawing threat diagrams
- Guided analysis of threats and mitigations
- Integration with bug tracking systems
- Robust reporting capabilities

SDL Template for VSTS (Spiral)

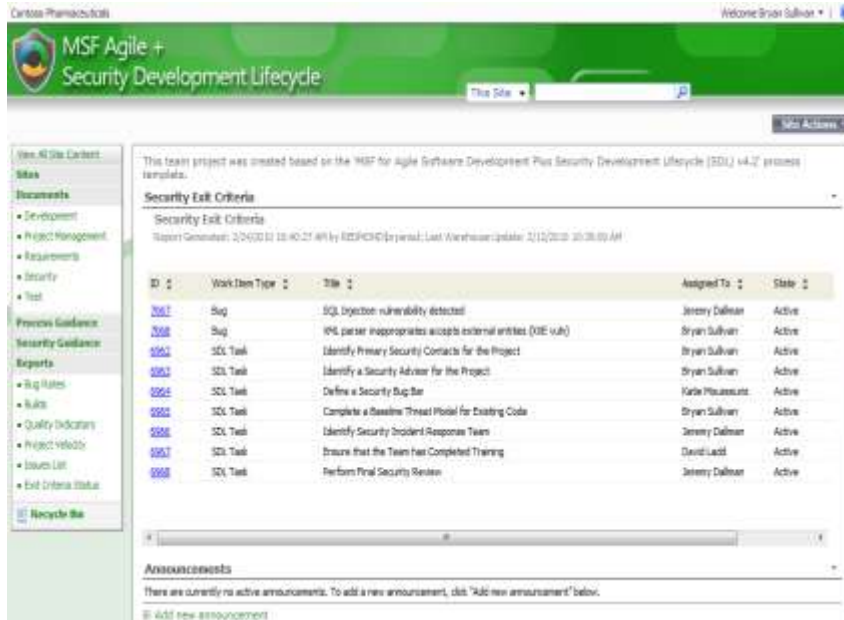

- Incorporates
 - SDL requirements as work items
 - SDL-based check-in policies
 - Generates Final Security Review report
 - Third-party security tools
 - Security bugs and custom queries
 - A library of SDL how-to guidance
- Integrates with previously released free SDL tools
 - SDL Threat Modeling Tool
 - Binscope Binary Analyzer
 - Minifuzz File Fuzzer

The SDL Process Template integrates SDL 4.1 directly into the VSTS software development environment.

MSF Agile + SDL Template for VSTS

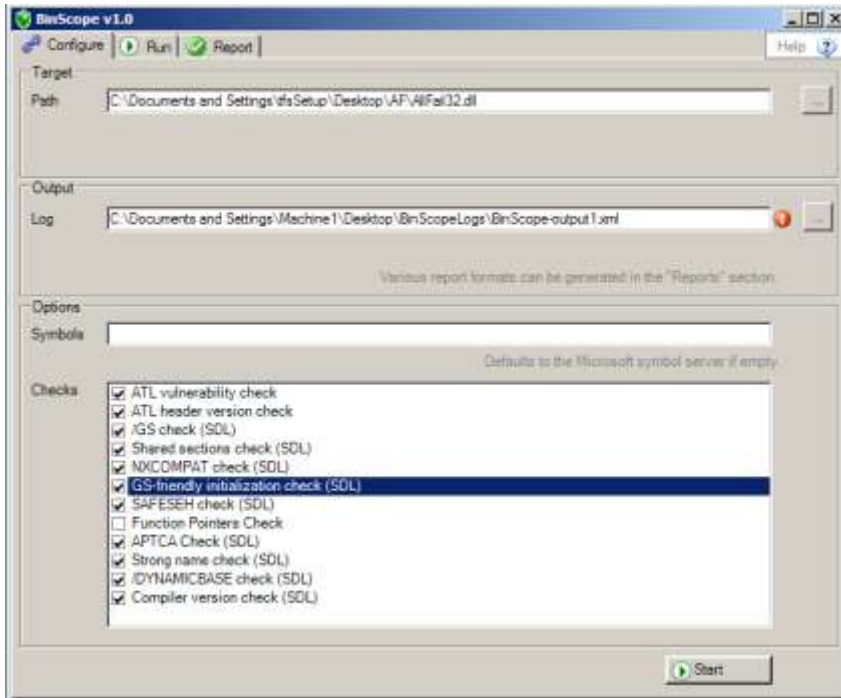

- Incorporates SDL-Agile secure development practices directly into the Visual Studio IDE - now available as beta (planned release at the end of Q2CY10)

- Automatically creates new security workflow items for SDL requirements whenever users check in code or create new sprints
- Ensures important security processes are not accidentally skipped or forgotten
- Integrates with previously released free SDL tools
 - SDL Threat Modeling Tool
 - Binscope Binary Analyzer
 - Minifuzz File Fuzzer
- Will be updated for VS2010

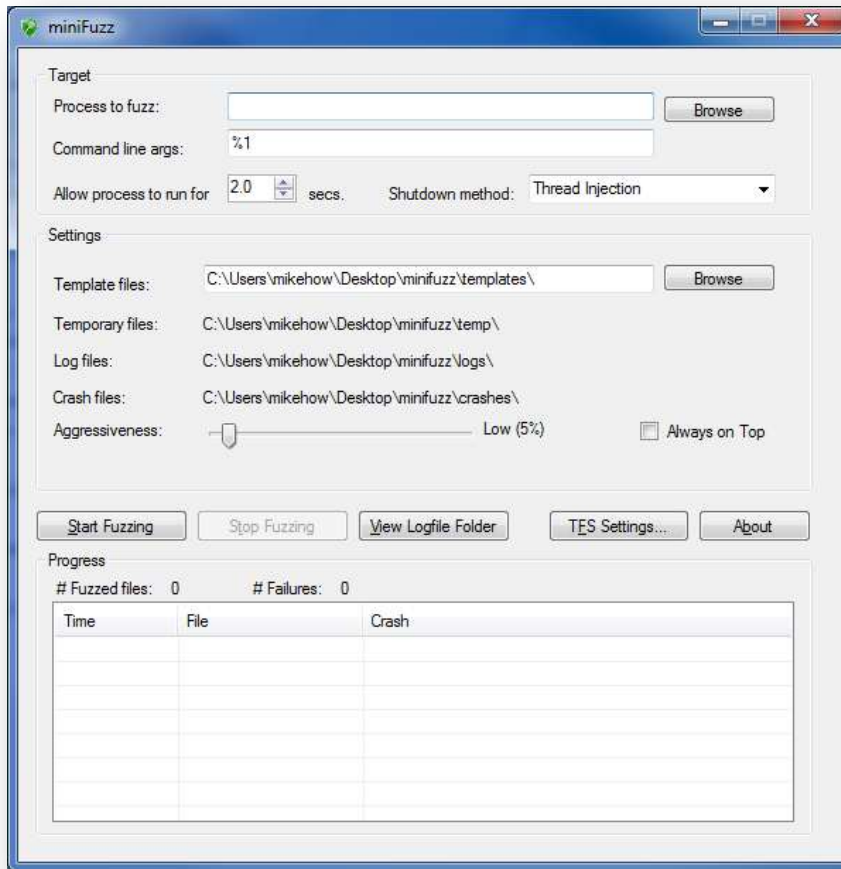

Binscope Binary Analyzer

- Provides an extensive analysis of an application binary
- Checks done by Binscope
 - /GS - to prevent buffer overflows
 - /SafeSEH - to ensure safe exception handling
 - /NXCOMPAT - to prevent data execution
 - /DYNAMICBASE - to enable ASLR
 - Strong-Named Assemblies - to ensure unique key pairs and strong integrity checks
 - Known good ATL headers are being used
- Use either standalone or integrated with Visual Studio (VS) and Team Foundation Server (TFS)

MiniFuzz File Fuzzer

- MiniFuzz is a basic testing tool designed to help detect code flaws that may expose security vulnerabilities in file-handling code.
 - Creates corrupted variations of valid input files
 - Exercises the code in an attempt to expose unexpected application behaviors.
 - Lightweight, for beginner or advanced security testing
 - Use either standalone or integrated with Visual Studio (VS) and Team Foundation Server (TFS)

SDL and Creative Commons

- Up to this point, Microsoft has released SDL information using a license that did not allow for reproduction, inclusion or transfer of any part of our documentation or process without express written consent from Microsoft.
- From this point forward, Microsoft will be making our publicly available SDL documentation and other SDL process content available to the development community under a Creative Commons license.
 - Specifically, we will be using the license that specifies ***Attribution, Non-Commercial, Share Alike (cc by-nc-sa)*** terms.
(<http://creativecommons.org/licenses/by-nc-sa/3.0/>)
 - This won't apply for any of the **SDL tools** released by Microsoft – those will continue to use existing Microsoft licenses.
- First two papers republished under CC license:
 - **“Simplified Implementation of the Microsoft SDL”** whitepaper and the **Microsoft Security Development Lifecycle (SDL) - Version 5.0**

Summary

- You're here, so you all understand the importance of building secure software
- Integrating security into a development process *and organization* requires commitment and time
- Our experience has shown that the SDL is an effective process – and that it can be applied beyond Microsoft
- We've made a lot of resources freely available to help other organizations apply the SDL
