<u>**OWASP Web Services Security Project**</u>

What is the Project about?

The OWASP Web Services Security Project aims to centralize links to all security related resources in the topic of Web Services. The primary goals of the project are to facilitate a one-stop-shop model for any Web Services security related inquiry and to maximize its visibility so that anyone searching for Web Services security is greeted by the projects home page.

The project, at its current state aims to provide links to resources from the following aspects of Web Services:

- WS Security Docs/Presentations
- WS Standards
- WS Communications
- XML Security
- Testing Web Services
- WS Tools
- WS Gateways
- SOA Architecture and Design
- WS Implementation Platforms

Each of the above aspects will provide the user with a set of links from both OWASP and external resources. The project is NOT a standalone project and will be heavily dependent on the availability of the resources that it links to from the various sections.

Who would benefit from this Project?

The project is aimed at a wide audience. From links to development resources, SOA architecture, Web Services testing and Standards the content linked to from different sections of this project is aimed to be as comprehensive as possible irrespective of the user's background.
