

# Securing Development with PMD

Teaching an Old Dog New Tricks

Well, this trick has been around for five years now, so we might be able to learn it...

31/08/2012

# Integrating Security with Developer Tooling

## Key Objectives

- Learn about PMD
- Understand how to extend PMD
- Think about enhancements to similar tools

#### What Is PMD?

- Open source static analysis tool
- Scans Java source code for potential problems
  - Possible bugs
  - Dead code
  - Suboptimal code
  - Overcomplicated expressions
  - Duplicate code

Very little related to security!!

#### Bug Finders vs Security Static Analysis

- Bug Finders (i.e. PMD)
  - Target buggy patterns
  - Minimize false positives even if high false negatives
- Security Static Analysis
  - Target insecure patterns
  - Minimize false negatives even if some false positives
  - Context of violation must be investigated

#### Why Extend Security to PMD?

- Used extensively by Java developers already
- Highly extensible with Rule and Report API
- Strong documentation and support network
- Integrates with many IDEs and build tools
- PMD internals operate similar to commercial tools

#### How does PMD work?

- Run against source file, directory, or archive
- Builds tree-like structure of source code (AST)
- Performs semantic, basic control & data analysis
- Traverses AST looking for patterns (Rules)
- Generates a report of Rule Violations

#### What Does AST Look Like?

```
class Example {
  void bar() {
   while (baz)
    buz.doSomething();
  }
} Source Code
```

```
CompilationUnit
TypeDeclaration
  ClassDeclaration: (package private)
   UnmodifiedClassDeclaration(Example)
    ClassBody
    ClassBodyDeclaration
      MethodDeclaration: (package private)
       ResultType
      MethodDeclarator(bar)
        FormalParameters
       Block
        BlockStatement
         Statement
          WhileStatement
           Expression
            PrimaryExpression
             PrimaryPrefix
              Name:baz
           Statement
            StatementExpression:null
             PrimaryExpression
              PrimaryPrefix
               Name:buz.doSomething
              PrimarySuffix
 AST
               Arguments
```

#### Extending PMD with Custom Rules

- Implement as <u>Xpath expression</u> or <u>Java class</u>
- Wire up rules for use by PMD in ruleset file
- Modify behavior by configuring rule properties
- Group rules into rulesets for enforcement

DEMO

# **Xpath Rule Writing Demo**

31/08/2012

#### Resources to Help Writing Rules

- PMD Website
  - http://pmd.sourceforge.net/xpathruletutorial.html
  - http://pmd.sourceforge.net/howtowritearule.html (Java)
- PMD source code
  - net.sourceforge.pmd.rules.\*
  - net.sourceforge.pmd.dfa.DaaRule
- PMD Applied (Centennial Books Nov 2005)
- PMD test cases & framework (wraps JUnit)
  - test.net.sourceforge.pmd.testframework
  - test.net.sourceforge.pmd.\*

#### v1.0 Goals For Custom PMD Security Rules

- Add security without modifying PMD itself
- Write rules that identify "low hanging fruit"
- Perform analysis beyond lexing and pattern match

## Selecting Rules for Implementation

GDS Assessment Vulnerability	Customer's Secure Coding Guideline(s)	Rule Type	OWASP Top 10
SQL Injection	2.1 – Commands should not be Constructed through String Concatenation	Data Flow, Structural	A1: Injection
Cross-Site Scripting (XSS)	<ul> <li>1.1 – All Input Crossing a Trust Boundary</li> <li>Must be Validated</li> <li>1.2 – Data from External Sources must be</li> <li>Properly Encoded or Escaped</li> </ul>	Data Flow	A2: Cross-Site Scripting (XSS)
Arbitrary File Retrieval	<ul> <li>1.1 – All Input Crossing a Trust Boundary</li> <li>Must be Validated</li> <li>3.2 – Callable Code Must Enforce</li> <li>Authorization Requirements</li> </ul>	Data Flow	A4: Insecure Direct Object References
Use of Cryptographically Insecure Algorithms	4.1 – Use of Sound Encryption Algorithms 4.2 – Use of Sound Hashing Algorithms	Structural	A7: Insecure Cryptographic Storage
Arbitrary URL Redirection	1.1 – All Input Crossing a Trust Boundary Must be Validated	Data Flow	A10: Un-validated Redirects and Forwards

# Challenges to Writing PMD Security Rules

PMD Analysis Limitations	Impact on Detecting Security Bugs	
<ul> <li>Analysis limited to single file at a time</li> <li>Data Flow Analyzer (DFA) limited to single method (intraprocedural)</li> </ul>	<ul> <li>Data often passes through multiple files/ classes and tiers</li> </ul>	
<ul> <li>DFA tracks local variable declarations and references, but does not evaluate expressions</li> </ul>	<ul> <li>Security bugs often result of mixing data and code in wrong context</li> </ul>	
<ul> <li>Symbols limited to source file, resulting in names and types not fully resolved</li> </ul>	<ul> <li>Custom code often wraps well-known</li> <li>APIs (Java or Framework)</li> </ul>	
<ul> <li>Only analyzes JSP files that are XHTML- compliant (i.e. JSP Documents / XML syntax)</li> </ul>	<ul> <li>Standard JSP syntax more common</li> <li>Often severe web application security bugs in presentation layer</li> </ul>	

#### Rule Writing Challenges – JSP Files

#### #1 – Overcome XHTML limitation

- Solution: Leverage JSP compiler
- Result: Java implementation of JSP logic in \_jspService method
- Benefit:
  - Identify security bugs in any JSP
  - Scope of PMD's analysis increased

#### Example of JSP to Java Translation

## Rule Writing Challenges – Reporting

#2 – Report JSP security violations meaningful to developer

#### Solution:

- Wrote custom Source Map Format (SMAP) translator (JSR-045)
- Implemented net.sourceforge.pmd.IRuleViolation
- Result: Report findings in terms of JSP line numbers
- Benefit:
  - JSP developers remediate bugs in JSP
  - Security violations understood by PMD built-in renders

#### SMAP Example

SMAP index7\_jsp.java

Header (SMAP, generated filename, default stratum)

JSP \*S JSP

**Stratum Section** 

\*F

+ 0 index7.jsp

index7.jsp

\*[

2,10:53,0

12,3:55

14:58,0

15:60

16,3:61,0

\*E

File Section (contains translated filenames and path)

Line Section (associates line numbers in input source with output source)

End Section

DIGITAL SCIENCE

#### Rule Writing Challenges - DFA w/PMD

#3 – Despite PMD limitations, perform data flow analysis

- Solution: Use PMD DFA and Symbol Table
- Result:
  - Determine if variable assignments assigned source
  - Track those tainted variables down each data flow
  - Report security violations if tainted variable passed to sink
- Benefit: Automated, accurate tracing from source to sink

#### PMD Data Flow Analysis

```
public void jspService(HttpServletRequest request,
   HttpServletResponse response)
         throws java.io.IOException, ServletException
                                              variable definition
..snip...
                                              Name=a1, Type=String
 String a1 = request.getParameter("y1");
                                                   DataFlowNodes
 String b1 = a1;
   out.print(b1);
             variable references
             Name=request.getParameter
             Arguments=y1 (Literal)
```

31/08/2012

#### PMD Data Flow Analysis

```
public void jspService(HttpServletRequest request,
   HttpServletResponse response)
        throws java.io.IOException, ServletException
..snip...
 String a1 = request.getParameter("y1");
                                             variable references
                                             Name=out.print
                                             Arguments=b1 (Name)
 String b1 = a1;
   out.print(b1);
                                         DataFlowNode
```

#### PMD Data Flow Analysis

```
String a1 = request.getParameter("y1");
```

```
String b1 = a1;
out.print(b1);
```

# variable reference Name=request.getParameter Arguments=y1 (Literal)

Name=request.getParameter
(method, tainted source)
Arguments=y1 (Literal)
Type= javax.servlet.http.HttpServletRequest

out.print(b1);

```
public void jspService(HttpServletRequest request,
   HttpServletResponse response)
         throws java.io.IOException, ServletException
                                              variable definition
..snip...
                                              Name=b1, Type=String
                                              (tainted variable)
 String a1 = request.getParameter("y1");
 String b1 = a1;
   out.print(b1);
                                variable reference
                                Name=a1 (tainted variable)
```

```
public void jspService(HttpServletRequest request,
   HttpServletResponse response)
         throws java.io.IOException, ServletException
..snip...
 String a1 = request.getParameter("y1");
                                       variable references
 String h1 = a1
                                      Name=out.print
                                      Arguments=b1 (Name)
 out.print(b1);
                                      (tainted variable)
```

```
public void jspService(HttpServletRequest request,
   HttpServletResponse response)
        throws java.io.IOException, ServletException
..snip...
 String a1 = request.getParameter("y1");
                                     variable references
 String h1 = a1:
 out.print(b1);
```

Name=out.print (method, XSS sink) Type=javax.servlet.jsp.JspWriter Arguments=b1 (Name) (tainted variable)

**XSS Vulnerability** 

#### DFA Security Rule Usage Notes

- Violations need to be manually investigated for proper escaping/validation
- Configurable sources and sinks via properties
  - URL Redirection
    - javax.servlet.http.HttpServletResponse.sendRedirect
  - SQL Injection
    - java.sql.execute
- Effective source/sink same method / "reflected" variants

#### PMD Structural Rule Example – SQLi

- DFA susceptible to false negatives
  - Data traverse multiple files between source and sink
- Supplement with structural rule
  - Investigates AST AdditiveExpression nodes
  - Performs following analysis
    - Is string a SQL command?
    - Is concatenated data of type String?
    - Is concatenated data a method argument?

DEMO

# Using PMD Security Rules

31/08/2012

#### Basic Usage Steps

- Configure CLASSPATH
  - Add pmd-gds-1.0.jar
  - Add jars/classes used when building (for type resolution)
- Configure PMD to use /rulesets/GDS/ SecureCodingRuleset.xml
- Run PMD and audit results

#### PMD ANT Task Example - CLASSPATH

```
<path id="pmd.classpath">
<fileset dir="${pmd.dir.home}\lib">
 <include name="pmd-${pmd.version}.jar" />
  ..snip..
</fileset>
<pathelement location="lib\${gds.jar}" />
<pathelement location="${app1.src}\build\classes\"/>
<fileset dir="C:\tomcat\apache-tomcat-6.0.29\lib">
    <include name="servlet-api.jar" />
</fileset>
</path>
<target name="pmd" description="Runs PMD">
<taskdef name="pmd" classname="net.sourceforge.pmd.ant.PMDTask"</pre>
    classpathref="pmd.classpath" />
<pmd rulesetfiles="rulesets/GDS/SecureCodingRuleset.xml" shortFilenames="false"</pre>
  <formatter type="text" toConsole="true" />
 <fileset dir="${app1.src}"><include name="**/*.java" /></fileset>
</pmd>
</target>
```

#### PMD ANT Task Example - Rules Config

```
<path id="pmd.classpath">
<fileset dir="${pmd.dir.home}\lib">
 <include name="pmd-${pmd.version}.jar" />
  ..snip..
</fileset>
<pathelement location="lib\${gds.jar}" />
<pathelement location="${app1.src}\build\classes\"/>
<fileset dir="C:\tomcat\apache-tomcat-6.0.29\lib">
   <include name="servlet-api.jar" />
</fileset>
</path>
<target name="pmd" description="Runs PMD">
<taskdef name="pmd" classname="net.sourceforge.pmd.ant.PMDTask"</pre>
    classpathref="pmd.classpath" />
<pmd rulesetfiles="rulesets/GDS/SecureCodingRuleset.xml" shortFilenames="false"</pre>
  <formatter type="text" toConsole="true" />
 <fileset dir="${app1.src}"><include name="**/*.java" /></fileset>
</pmd>
</target>
```

## Configuring JSP to Java Translation

- Add JSP compiler task to build tool (build.xml)
- Configure smapSuppressed to false and smapDump to true

```
<jasper2 validateXml="false" uriroot="C:\Code\web.war"
   webXmlFragment="${jspBuildDir}/WEB-INF/
   generated_web.xml" outputDir="${jspBuildDir}/WEB-INF/
   src" smapSuppressed="false" smapDumped="true"/>
```

 Add extra clean task to remove .smap files before production deployment

## Custom Rules with PMD Eclipse Plug-in

- Plug-in only supports xpath rules out of box
- Put custom rules on plug-in CLASSPATH
  - Requires modification of PMD Eclipse plugin jars
  - Add rules to PMD Eclipse plugin source and compile
  - Wrap PMD Eclipse plugin with custom plugin

#### Current and Future Development

- Publish version 1.0 of Secure Coding Ruleset @ <a href="https://github.com/GDSSecurity">https://github.com/GDSSecurity</a>
- Integrate NIST Juliet Test cases
- Contribute to PMD project (need to pass tests first!)
- Extend rules beyond Java with PMD 5
- Write PMD 5.0 Rules
- Enhance PMD feature set

#### Conclusion

- Learned about PMD and extensibility
- Discussed approach for rule writing & deployment
- Use, add and improve SecureCodingRuleset on GitHub
- Look for other developer tools where it would be practical to add security
